1

Introduction

Our Client

WeCare

a national non-profit healthcare
provider, is building a

vMD

(virtual doctor) .

*We are tasked with building a
image classifier that can identify
pediatric pneumonia*

Why Pneumonia?

High Social Cost

* 6th leading cause of pediatric death in the U.S.

*1.9 million children die of pneumonia each year

High Economic Cost

About a billion dollars

2

Methodology

Methodology

1

Read in x-rays

2

Build CNN

3

Fine tune models

What's a CNN?

3

RESULTS

Results

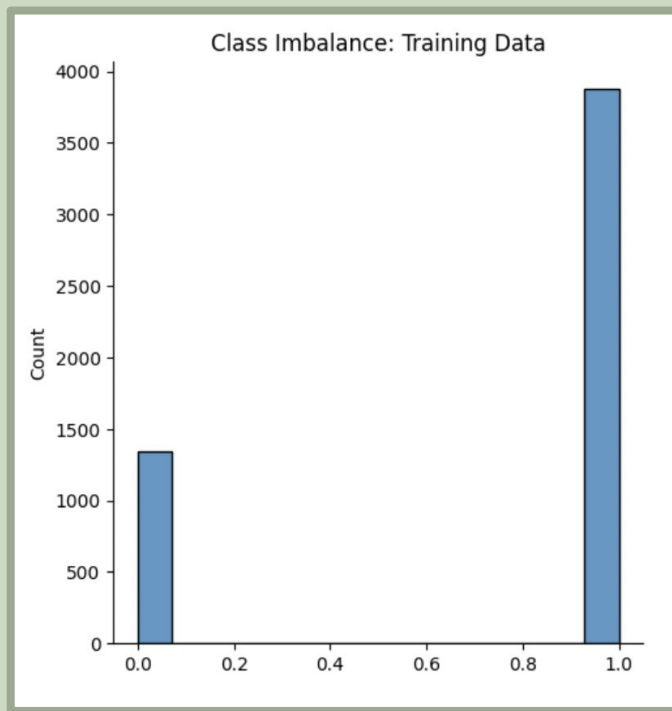

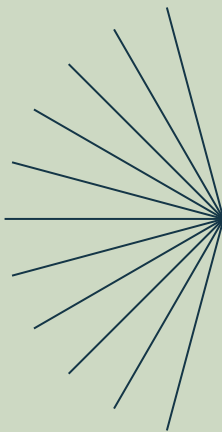

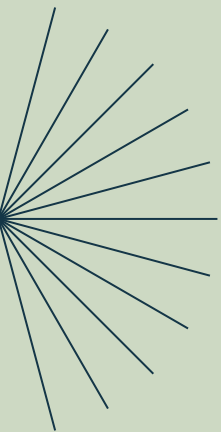

4

LIMITATIONS

Class Imbalance

84%

accuracy for our test set

11%

of our test pneumonia cases
misclassified as normal

23%

of our test actual normal cases
misclassified as pneumonia

5

RECOMMENDATIONS

human diagnosis accuracy rate:

59%

Our model is ready for deployment

We should continue to fine tune, experimenting with cutoff rates, image augmentation, and weight adjustments.

Thank You

for your time

And special thanks to FlatIron, especially to A.
Kulkani, my instructor
